Project Title: Multi-Platform OTT Streaming Application Testing

Role: QA Engineer
Period: April 2023 – Present
Company: GlobalLogic (Client: Leading US-Based Broadcasting Company)
Platforms: Android Mobile, , Web, Android TV, Fire TV, tvOS, Roku
Type: Full-time / Remote

Project Overview:

Contributed to the quality assurance of multiple streaming applications developed by a major international broadcasting company. These platforms deliver digital content across a wide range of devices, including Smart TVs, mobile platforms, and web browsers. The role involved extensive multi-platform testing, direct communication with international teams, and contributions to manual QA processes.

Key Responsibilities:

- Performed **manual testing** on a variety of platforms, including **Android Mobile, Android TV, Fire TV, iOS, tvOS, Roku, and Web**.
- Executed **Functional, Non-Functional, Smoke, Sanity, Regression**, and **End-to-End** testing across releases.
- Reviewed feature requirements and **created, executed, and maintained test cases** to ensure comprehensive test coverage.
- Investigated and reported bugs using tools like **Jira** and provided **QA sign-off** for production releases.
- Communicated with **product owners, developers, designers, other QA engineers**, and daily collaboration with **US-based teams**.
- Served as a **report manager**, conducting 1:1s, gathering weekly status updates, and approving vacations for multiple team members.
- **Mentored and onboarded** new QA engineers; contributed to candidate interviews.
- Worked with the **automation team**, applying basic Python skills to fix and maintain simple test scripts.
- Took responsibility for **rewriting and standardizing test cases** to ensure consistency across all supported platforms.
- Occasionally **coordinated tasks between QA engineers**, especially in cross-platform efforts.

- Performed testing directly from the **development branch**, without waiting for build distribution.

Technologies & Tools:

- **Test & Debug:** Jira, Qase, Allure, Charles Proxy, Fiddler, Sentry, Chrome DevTools, ADB, Android Studio
- **API & Automation:** Postman, Python (basic test automation support)
- **Collaboration & Design:** Figma, WordPress, Apollo
- **Version Control & CLI:** Git, Command Line
- **Infrastructure:** VPN setup (including router-level configuration)
- **Operating Systems:** Windows (primary), Linux (basic usage)

Methodologies:

- Agile (Scrum): Participation in **sprint planning, estimation**, and daily stand-ups
- Involved in **feature and design reviews**, including requirement analysis and test-case review
- Delivered **QA sign-off** at the end of test cycles
